

**WELCOME FALL!**

*It's time to GET CREATIVE!*

**\* PUMPKIN CARVING TIME**

Post your carved pumpkin on Facebook or Instagram with **#SeussPedoOrtho** and be entered to win a \$50 Gift Card to Hobby Lobby or Amazon.

Contest runs Oct. 1-31  
Winners announced Nov. 2, 2020. HAVE FUN!

**October is National Orthodontic Health Month!** Help us celebrate by learning more about orthodontists and how they do more than give people a better-looking smile. According to MouthHealthy.com, orthodontics and dentofacial orthopedics is the formal name of the dental specialty concerned with the diagnosis, prevention, intervention, guidance and correction of bad bites.

The purpose of orthodontic treatment is to create a healthy bite - straight teeth that properly meet opposing teeth in the opposite jaw. A good bite makes it easier to bite,

chew and speak. If your child's teeth are crowded, protrusive, spaced too far apart, meet in an abnormal way or do not meet at all, correction may be recommended. If your child has an abnormal bite Dr. Kerr may recommend an orthodontic consultation. Correcting the problem can create a nice-looking smile, but more importantly, orthodontic treatment results in a healthier mouth. Not correcting an abnormal bite could result in further oral health problems, including tooth decay, gum disease, tooth loss and jaw problems.

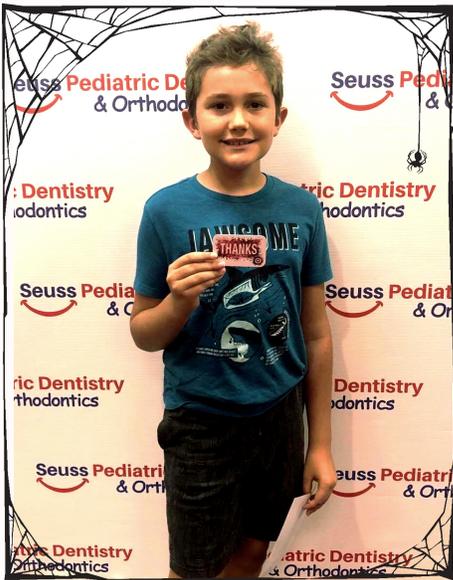

Braces and aligners are the "appliances" orthodontists most commonly use to guide teeth into their proper positions. Retainers preserve and stabilize the results of your orthodontic treatment. Since abnormal bites usually become noticeable between the ages of 6 and 12, orthodontic treatment often begins between ages 8 and 14. Treatment that begins while a child is growing helps produce optimal results. If you have any questions about your child's smile, please let Dr. Kerr know. Happy National Orthodontic Month!

*Welcome!*
